Análisis Estadístico de la Edad de la Credencial, Edad al Primer Trámite y de la consistencia del Padrón

Con el propósito de revisar la consistencia del padrón y al mismo tiempo revisar la edad a la que los ciudadanos se registran por primera vez y la edad que tienen las credenciales, tomando por el momento sólo las que fueron emitidas por primera vez, para cada estado se hizo un cálculo de la edad (edadtramite1) a la que el ciudadano tramita su primera credencial, y la edad que tiene actualmente su credencial (edad_credencial) esta variable sólo para las credenciales emitidas por primera vez Esto se llevó a cabo para los padrones de 2003 y 2006, para evaluar la consistencia de los padrones a través de los resultados.

HISTOGRAMAS

Los histogramas presentan en el eje vertical la densidad, esto significa que las frecuencias están divididas por el total, de manera que la suma de la altura de las barras es uno. Esto permite comparar los histogramas de un tiempo a otro o comparar un estado con otro.

Para los padrones de 2003 y 2006 y para cada estado se hicieron cinco histogramas de la edad de la credencial tomando en cuenta sólo la primera credencial, el primero para la edad de la credencial en el estado, el segundo dividiendo a los sujetos de acuerdo a si están empadronados en el estado que nacieron a esta variable se le llamó *coincidencia con lugar de nacimiento*, el tercero dividiendo por la *ocupación* de los individuos, el cuarto dividiendo por *sexo* y finalmente el quinto dividiendo a los individuos de acuerdo a si pertenecen a una zona de tipo urbana, mixta o rural, esta variable se le llamó simplemente *tipo*.

En el padrón de 2003, en general se encontró que las barras más altas en la gran mayoría de los histogramas corresponden a la edad de credencial de 12 y 13 años . Haciendo las divisiones de los individuos por las diferentes variables el patrón de las gráficas es más o menos el mismo: con barras muy altas sobre 12 y 13 años, un gran descenso en la barra de 11 años y con repuntes cada tres años que corresponden a los años de elecciones 1994, 1997, 2000, 2003 y 2006. Donde no se repite este comportamiento es en los histogramas donde se divide por ocupación, cuando el grupo corresponde a estudiante o buscador de trabajo los histogramas tienen un comportamiento donde la altura de las primeras barras, de uno año a cuatro años son las más altas y no en todas las demás ocupaciones la barra de 12 y 13 años es la más alta.

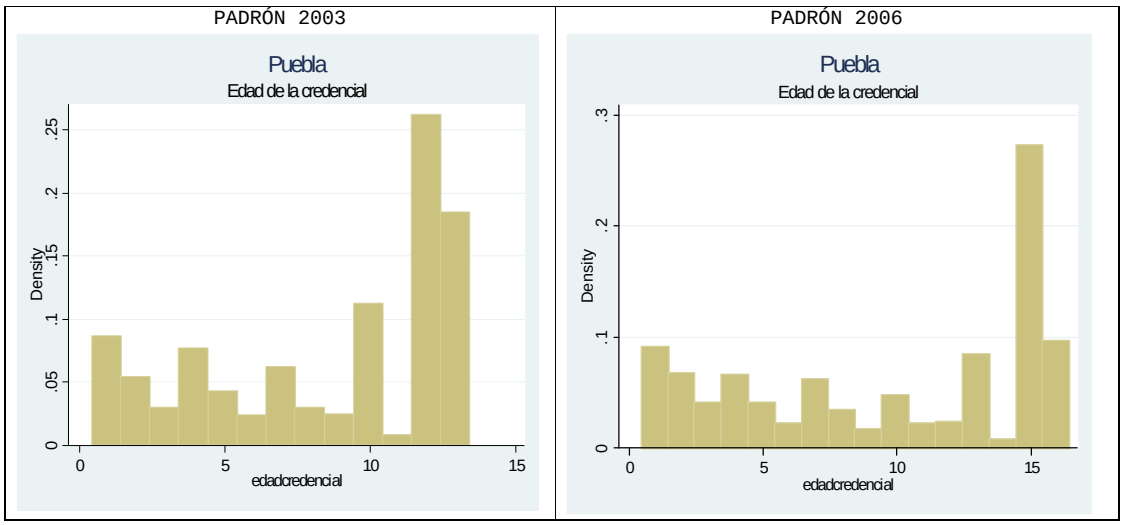
Al comparar los histogramas del padrón 2003 con los de 2006 puede apreciarse que prácticamente son iguales como si sólo se insertaran al principio las barras de que corresponden a los años 2004, 2005 y 2006, que corresponden a las edades de credencial de 1 a 3 años y siendo la de un año más alta que la de dos y tres años. Al tenerse más barras, las alturas de las primeras, en este caso 15 años es más baja ya que el área debe sumar uno.

Los efectos de estas variables: *coincidencia con lugar de nacimiento, ocupación, sexo y tipo* sobre la edad de la credencial de manera simultánea no es posible verlos en los histogramas es por eso que se usaron modelos de regresión que se explican más adelante.

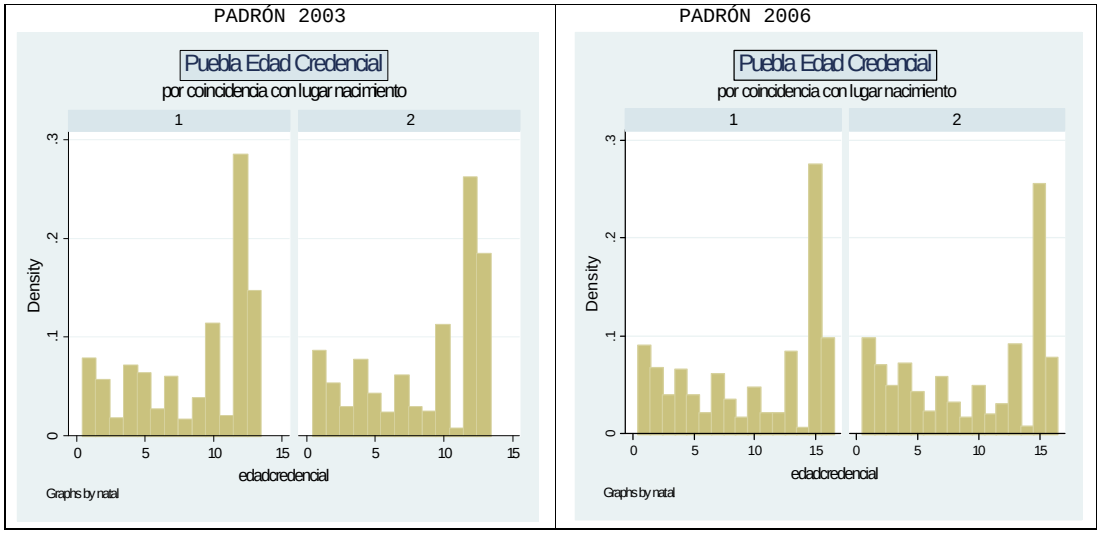
EJEMPLO

A continuación se presenta como ejemplo el estado de Puebla. Los dos primeros histogramas son para la edad de la credencial, en 2003 las dos barras más altas están sobre los 12 y 13 años, que corresponden a los años 1991 y 1992, cuando se inició la credencialización con fotografía, sumando las alturas de estas dos barras se ve que aproximadamente el 45% de los individuos tienen una credencial con al menos 12 años, se ven repuntes en los años de elecciones presidenciales e intermedias. Para el 2006 la altura de las dos barras más altas: 15 y 16 años suma alrededor de 38%; también para 2006 se ve que los empadronamientos repuntan en los años de elecciones presidenciales y en las intermedias. Comparando las barras que se encuentran más a la derecha y que corresponden a 1991, en 2003 es de aproximadamente 18% mientras que en el 2006 es de 10%. Este comportamiento es similar en todos los estados, es decir existe una disminución en porcentaje de las credenciales más viejas

.

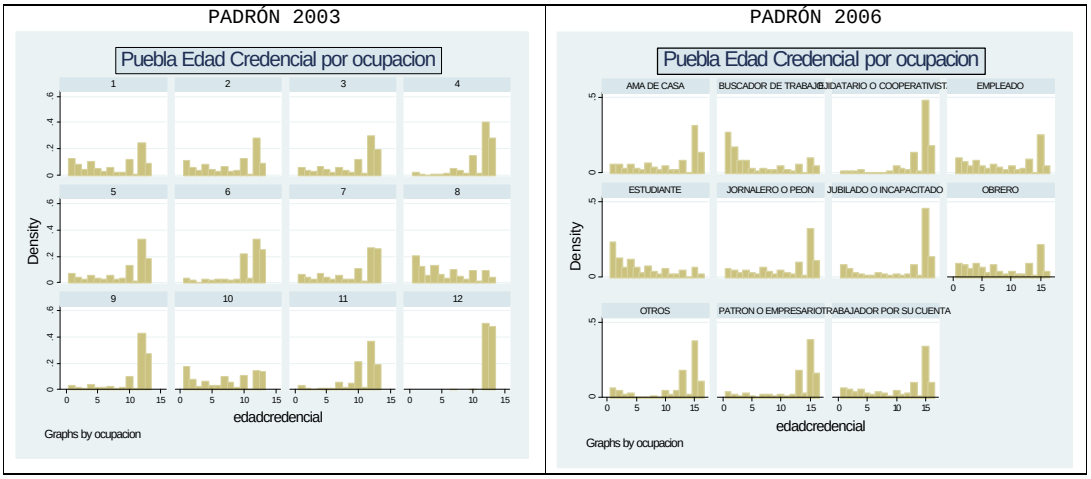


Los dos siguientes histogramas edad de la credencial por coincidencia con lugar de nacimiento, dividen a los individuos que están empadronados en el estado que nacieron de los que no (codificados con 1 si sí y 2 si no), para ambos padrones 2003 y 2006 se ve un comportamiento semejante, las barras más altas corresponden al año 1992 y 1991, y también ocurre que las barras que corresponden a un año en la credencial son un poco más altas en los histogramas de los individuos que se están empadronados en un estado diferente al que nacieron. Es importante hacer notar que dado que siempre es mayor el número de empadronados oriundos del estado que los que no lo son, así que el histograma bajo 1 fue construido con base en más individuos que el histograma bajo el 2.

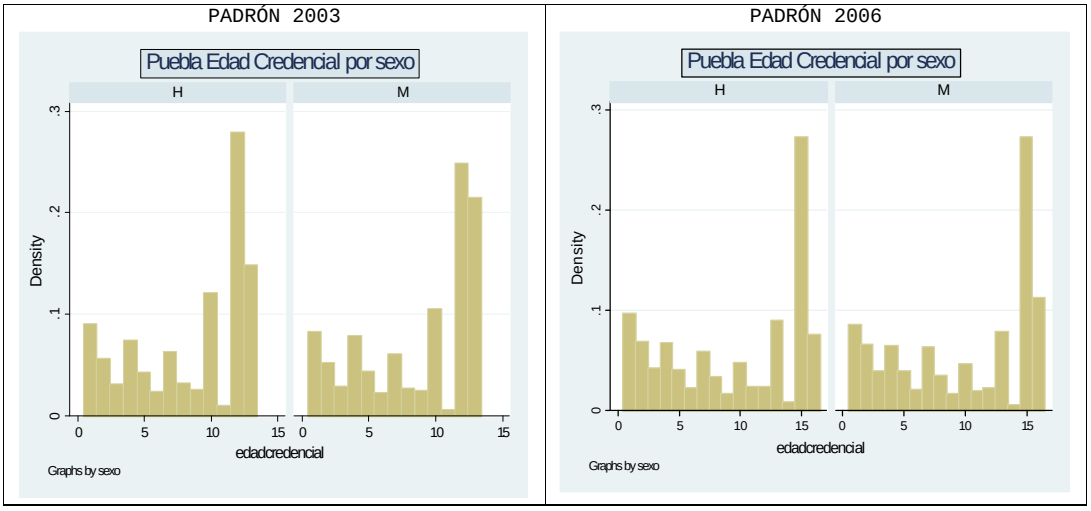


En estos otros histogramas los individuos fueron divididos por su ocupación, para el año 2003 las codificaciones son como sigue: 1 obrero, 2 empleado, 3 jornalero o peón, 4 ejidatario o cooperativista, 5 trabajador por su cuenta, 6 patrón o empresario, 7 ama de casa, 8 estudiante, 9 jubilado o incapacitado, 10 buscador de trabajo, 11otros. Para algunos estados hay otras codificaciones, en particular aparecen 0 y 12 que habría que revisar y redefinir.

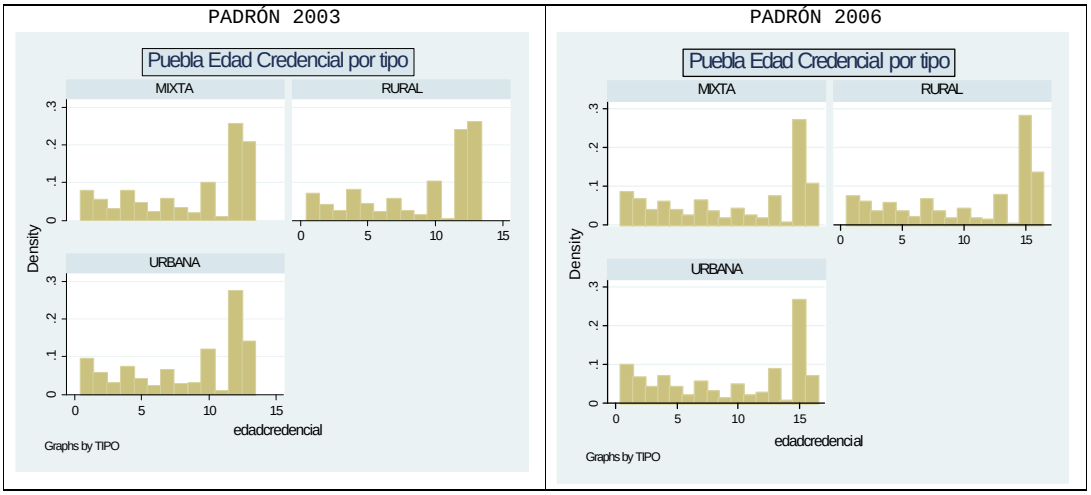
Los grupos de obrero, estudiante y buscador de trabajo son los que presentan barras más altas cuando la edad de credencial es menor a 4 años.



En los siguientes histogramas la variable que se usó para dividir a los individuos fue el sexo, en estos histogramas se encontró que las últimas dos barras de la derecha que corresponden a 12 y 13 años de edad de la credencial, al sumarlas dan un porcentaje que resulta más alto para las mujeres que para los hombres. De un año a otro la edad de la credencial se comporta prácticamente igual.



Separando a los individuos de acuerdo a si pertenecen a una zona clasificada como rural mixta o urbana, se encontró que es en las zonas clasificadas como rural donde la barra de 13 años aparece más alta en zona rural, seguida por la zona mixta y menos alta en la urbana. Si se pone atención en la primer barra, la de 1 año, se ve que esta barra es más alta en las zonas urbanas que en las zonas mixtas y rurales.



El total de histogramas para cada padrón se presenta al final como un apéndice, se puede observar que con la excepción de Oaxaca estos patrones son muy consistente en ambos padrones.

Modelos de Regresión

Con la variable edad de la credencial, se realizaron regresiones tomando como variables independientes el tipo de sección (variable tipo: rural, urbana y mixta), el género del ciudadano (variable sexo), la ocupación reportada (variable ocupación), la edad actual (variable edad) y una variable indicadora del estado de nacimiento (variable natal), la cual toma el valor de uno si el ciudadano nació en el estado a analizar y cero en otro

caso. El objetivo de esos modelos es descriptivo, no predictivo, es decir buscamos ver cuales son los factores que están más asociados con el envejecimiento de la credencial y por otra parte ver si ha habido un cambio importante entre los padrones de 2003 y 2006. Es claro que, dado el tamaño de los padrones todos los efectos resultan significativos, al incluir las interacciones de dos variable, cualquiera de las interacciones con tipo de sección resulta significativa, no así las demás. Es importante explicar que la relación de ocupación con sexo siempre existe, ya que mayoritariamente la categoría ama de casa es realizada por mujeres, sin embargo, al incluir el término de la interacción pocas veces resulta significativo. Para facilitar la interpretación, sólo se describirán los modelos con efectos principales para cada tipo de sección.

El modelo ajustado es el siguiente:

$$edad\_credencial = a_i + b_{i1} * sexo + b_{i2} * natal + b_{i3j} * ocupacion_j + b_{i4} * edad$$

con i=1,2,3, correspondiente a los tres tipos de sección (rural, urbana y mixta).

Los ajustes para todas las entidades federativas y tipos de secciones se presentan en un anexo, en esta parte sólo se hacen comentarios generales.

La variable sexo esta codificada como uno para las mujeres y cero para los hombres, de manera que un coeficiente positivo, significativamente diferente de cero, indica que las credenciales de las mujeres tienen una edad promedio mayor que las de los hombres para el tipo de sección ajustada, mientras que un coeficiente negativo se interpreta como que las credenciales de los hombres tienen una edad promedio mayor que la de las mujeres (las credenciales de las mujeres tienen una edad promedio menor que la de los hombres). La siguiente tabla muestra el signo del coeficiente para los tres tipos de secciones y las 32 entidades federativas en los dos tiempos, el símbolo * significa que el coeficiente no es significativamente diferente de cero.

En las secciones **urbanas**, el efecto del género en la edad de las credenciales es mayor en las mujeres que en los hombres, en todos los estados y en los dos tiempos.

En las secciones **mixtas**: Coahuila, Hidalgo y Puebla no presentan un efecto de género en el padrón de 2003, pero si en el 2006; en los dos primeros estados en el padrón de 2003 el coeficiente correspondiente indicaba un efecto mayor en la edad de las credenciales en las mujeres, aunque no significativo y en 2006 este coeficiente indica un efecto significativo en el mismo sentido. Mientras que en Puebla, en 2003 hay un efecto mayor en la edad de la credencial de los hombres no significativo, que en el 2006 se vuelve significativo. Querétaro no presenta un efecto significativo en ninguno de los tiempos y Campeche paso de tener un coeficiente que denotaba un efecto en la edad de la credencial mayor en las mujeres a uno no significativo en el mismo sentido. Guanajuato pasó de tener un efecto mayor en la edad de las credenciales de los hombres a un efecto no significativo en el 2006.

En Oaxaca y Yucatán hay mayor efecto del género masculino en ambos tiempos, de las restantes 24 entidades en 23 de ellas el efecto en la edad de las credenciales es mayor en las mujeres que en los hombres y el único estado que presenta un cambio de efecto significativo es Tlaxcala, en el 2003 el efecto edad de las credenciales de los hombres es mayor que el de las mujeres y en el 2006 es lo contrario. Este último cambio es explicado por un cambio en la distribución de las ocupaciones entre hombres y mujeres, la primera tabla contiene las frecuencias de las ocupaciones reportadas hasta 2002 y la segunda de 2003 a 2006.

Tlaxcala Frecuencias por ocupación con añotrámite1 menor a 2003

ocupacion	sexo H	sexo M
AMA DE CASA	**136**	**42,511**
BUSCADOR DE TRABAJO	238	124
EJIDATARIO O COOPERAT	4,840	28

PATRON O EMPRESARIO	5	0
TRABAJADOR POR SU CUE	927	98
Total	7,555	8,058

Existen cambios importantes en la distribución de las frecuencias relativas por ocupación, en las categorías de: ama de casa, jubilado y patrón que cambian de manera importante la proporción de hombres y mujeres, en este caso un modelo con los términos de interacción sería más adecuado.

Mientras que las secciones **rurales** en el 2003 el género masculino representa un efecto mayor en la edad de la credencial en Campeche, Guanajuato, México, Michoacán, Nuevo León, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Veracruz y Yucatán. El efecto de las mujeres en la edad de las credenciales en las secciones rurales es mayor en: Baja California Sur, Chihuahua, Durango, Guerrero, Sinaloa, Sonora y Tabasco. En Coahuila, Colima, y Nayarit en el 2003 no existe efecto de género y en el 2006, el efecto de las mujeres en la edad de la credencial es mayor que el de los hombres. En Aguascalientes, Baja California y Zacatecas en 2003 existe un efecto de los hombres en la edad de la credencial y en 2006 el efecto no es significativo. En el Distrito Federal, Quintana Roo y Tlaxcala no existe efecto en ninguno de los dos tiempos. En Jalisco y Morelos este efecto pasó de ser un efecto significativo en los hombres a significativo en las mujeres, estos dos últimos son los únicos que representan un cambio significativo en el efecto. En primer término para Morelos las siguientes tablas representan la frecuencia de la ocupación antes de 2003 y para el período de 2003 a 2006.

Morelos Frecuencias por ocupación con añotrámite1 menor a 2003

ocupacion	sexo H	sexo M
AMA DE CASA	172	59,360
BUSCADOR DE TRABAJO	833	343
EJIDATARIO O COOPERAT	1,537	19
EMPLEADO	19,316	10,515
ESTUDIANTE	5,909	6,790
JORNALERO O PEON	28,343	197
JUBILADO O INCAPACITA	1,450	274
OBRERO	5,027	571
OTROS	1,663	440
PATRON O EMPRESARIO	**145**	**50**
TRABAJADOR POR SU CUE	**9,689**	**2,138**

Morelos Frecuencias por ocupación con añotrámite1 entre 2003 y 2006

ocupacion	sexo H	sexo M
AMA DE CASA	41	6,256
BUSCADOR DE TRABAJO	262	137
EJIDATARIO O COOPERAT	73	0
EMPLEADO	3,581	1,731
ESTUDIANTE	3,118	3,584
JORNALERO O PEON	3,097	21
JUBILADO O INCAPACITA	193	56
OBRERO	351	39
OTROS	236	114
PATRON O EMPRESARIO	**16**	**3**
TRABAJADOR POR SU CUE	**976**	**234**

En este caso las categorías que cambian su distribución de frecuencias en los géneros son: patrón y trabajador por su cuenta

En el caso de Jalisco las tablas correspondientes son:

Jalisco Frecuencias por ocupación con añotrámite1 menor a 2003

ocupacion	sexo H	M
AMA DE CASA	**800**	**197,221**
BUSCADOR DE TRABAJO	1,364	465
EJIDATARIO O COOPERAT	10,369	145
EMPLEADO	74,673	40,077
ESTUDIANTE	15,258	17,145
JORNALERO O PEON	62,598	702
JUBILADO O INCAPACITA	4,545	555
OBRERO	30,203	4,633
OTROS	5,491	1,579
PATRON O EMPRESARIO	**741**	**159**
TRABAJADOR POR SU CUE	38,667	5,439

Jalisco Frecuencias por ocupación con añotrámite1 entre 2003 y 2006

OTROS	1,110	556	
PATRON O EMPRESARIO	**51**	**19**	
TRABAJADOR POR SU CUE	2,854	500	

Las categorías que cambian su distribución y enmascaran el efecto son: Ama de Casa, patrón y otros.

La variable natal esta codificada como uno si el ciudadano nació en el estado en que esta empadronado y cero si nació en cualquier otro lugar (otro estado o el extranjero), de manera que un coeficiente positivo significa que hay un efecto de haber nacido en el estado en que se esta empadronado en la edad de la credencial y si el coeficiente es negativo significa que existe un efecto de no haber nacido en el estado en que se está empadronado en la edad de la credencial.

Las credenciales obtenidas en el estado natal son siempre más antiguas, con la excepción de las secciones rurales de Quintana Roo en donde es contrario y las secciones rurales del Distrito Federal, mixtas de Puebla en 2003 y tanto las secciones mixtas como rurales en Guanajuato en el 2006 donde el efecto no es significativo.
En Quintana Roo las secciones urbanas en el 2006 presentan un efecto negativo de haber nacido en el estado en la edad de las credenciales, es decir el promedio de edad de las credenciales es mayor en los no nativos de Quintana Roo, cuando en el 2003 ese

efecto era positivo. Al revisar este cambio encontramos que en realidad las credenciales de los no nativos de Quintana Roo tiene en promedio mayor edad que la de los nativos desde 2003 y esta diferencia es estadísticamente diferente de cero, pero también el promedio de edad de los ciudadanos en el padrón es estadísticamente diferente para los no nativos que los nativos, en ambos padrones, al estar incluidas las dos variables, edad y natal en el modelo, la variable edad esta absorbiendo el efecto. Esto en el padrón de 2006 también sucede, sólo que el efecto de el lugar de nacimiento sólo se ve disminuido en su magnitud. Las regresiones para las regiones urbanas de Quintana Roo sin considerar la variable edad, se encuentran al final del archivo anexo.

En cuanto a la variable ocupación, en general no es posible encontrar un patrón en los diferentes tipos de secciones y entidades. Sin embargo con excepción de los casos mencionados previamente, por entidad la relación que guardan en los distintos tipos de secciones la ocupación con la edad de la credencial se mantiene de 2003 a 2006 y la contribución a explicar la edad de la credencial es importante. En términos generales, los estudiantes y buscadores de empleo tienen credenciales más recientes, sin embargo los jubilados o incapacitado también tienen credenciales recientes. En las zonas rurales los ejidatarios tienden a tener credenciales más antiguas, mientras que en las zonas urbanas los patrones o empresarios y los empleados tienden a tener las credenciales con mayor edad. El comportamiento de las amas de casa varía, pero en la mayor parte de las zonas rurales tienden a tener credenciales con mayor edad.

Análisis de Varianza

Por otra parte con la edad al primer trámite se ajustaron modelos de análisis de varianza de la forma siguiente

$$edadtramite1_{ij} = a_i + e_{ij}$$

donde i representa el año al que se hizo el trámite y j el ciudadano, el objetivo es probar si las medias a través de los diferentes valores de i son iguales. En este caso i toma valores de 1992 a 2003 en el padrón de 2003 y de 1992 a 2006 en el padrón de 2006. La razón de que no se consideró 1991 para realizar las pruebas de igualdad de medias es que en este año, por ser el primero, se esperaba que las medias de la edad de registro fueran más altas. En todas las entidades para los dos tiempos se rechaza la hipótesis de igualdad de medias, si quitamos también el dato de 1992, esta hipótesis se sigue rechazando.

En el anexo se presenta los valores de las medias de la edad en que se hizo el primer trámite para los dos padrones, así como las desviaciones estándar y el número de individuos que hicieron el trámite en ese año.

Si comparamos los datos del padrón del 2003 con los del padrón del 2006, vemos que son muy consistentes, el número de individuos por año varía muy poco, como consecuencia de las bajas y cambios de domicilio, por lo general el número de ciudadanos por año es menor en el 2006. Se puede observar que el promedio de la edad al primer trámite en el padrón del 2003 para el año 2003, creció cuando lo calculamos en el padrón de 2006, por lo que se esperaría que lo mismo ocurra con los datos del

2006, es decir el promedio de edad al primer trámite del año 2006 sea un poco mayor al final del año.

Si observamos la frecuencia, es decir el número de ciudadanos por año de trámite es muy claro que el año previo a las elecciones federales hay un incremento importante de registros, en todas las entidades, sin embargo en varias entidades en 2004 hubo un incremento en el registro al padrón por primera vez, dos años antes de las elecciones federales, manteniéndose durante 2005, estas entidades son: Chiapas, Distrito Federal, Guanajuato, Guerrero, Jalisco, México, Morelos, Nayarit, Oaxaca, Querétaro, San Luis Potosí y Veracruz.

Es claro que en todos los estados, la edad en que se realiza el primer trámite tiene una tendencia a disminuir, aunque en prácticamente todos los estados hay un incremento en la media de la edad alrededor de 2003 y 2004.

Esta tendencia en algunos estados es más rápida que en otros, por ejemplo el estado de Chiapas presenta para 1999 al 2003 un promedio de edad al primer tramite menor de 24 años, mientras que otros estados como Quintana Roo del 1997 al 2003 tiene un promedio de edad al primer trámite mayor de 26 años.

En todos los estados el promedio de la edad en que se realiza el primer trámite sigue estando por arriba de 20 años, siendo en el 2005 el valor más pequeño de un poco más 22 años que varios estados toman ese valor, mientras que el más alto de más de 27 años se da en Michoacán y en Oaxaca. En los trámites de 2006, el promedio menor fue de 21 años (Aguascalientes, México, Nayarit, Nuevo León y Tabasco) y el más alto 25 años en Baja California.

En la mayor parte de las entidades, el cambio más fuerte se da de 1994 a 1995, donde el promedio de edad del primer trámite baja hasta cuatro años. En el Estado de México este cambio es de 1993 a 1994 y en Guerrero no existe un cambio fuerte de un año a otro.

En Oaxaca el promedio de la edad, sin tomar en cuenta 2006 en donde es de poco más de 22 años, se ha mantenido de alrededor de 27 años.

En Michoacán a partir del 2003 hubo un incremento en el promedio de la edad al primer trámite, pero además se incrementó la desviación estándar de esta variable, esto es porque se registraron por primera vez algunos ciudadanos con edades grandes. Para ver el comportamiento se presenta la siguiente tabla, en donde se reporta el porcentaje de registros en el año correspondientes a cada grupo de edad:

Michoacán. Grupos de edad vs añodetramite1

	2000	2001	2002	2003	2004	2005
18-24	54.06	55.77	54.23	53.09	51.83	57.39
25-29	17.83	16.58	17.23	14.73	14.10	14.06
30-34	7.56	6.99	7.45	6.13	5.37	4.82
35-39	5.51	4.97	5.08	5.11	4.76	3.83
40-44	4.10	3.81	3.96	4.23	4.28	3.68
45-49	2.91	2.85	2.86	3.44	3.72	3.07
50-54	2.05	2.12	2.14	2.84	3.20	2.81
55-59	1.65	1.76	1.75	2.35	2.76	2.32

60-61	1.30	1.51	1.44	2.19	2.68	2.05
65-69	1.13	1.31	1.30	1.93	2.22	1.80
70-74	0.86	1.04	0.95	1.53	1.77	1.48
75-79	0.51	0.62	0.73	1.12	1.44	1.16
80-84	0.32	0.42	0.47	0.71	0.97	0.74
85-89	0.12	0.18	0.24	0.37	0.55	0.47
90-94	0.08	0.08	0.11	0.18	0.22	0.18
95-99	0.02	0.01	0.03	0.05	0.08	0.10
100-+	0.00	0.01	0.00	0.00	0.02	0.01

Como se puede ver a partir de 2003 existe un incremento en el porcentaje de ciudadanos de 55 años y más que hacen por primera vez su registro al padrón y aunque el incremento absoluto del porcentaje es pequeño, relativo a los reportados previamente es en ocasiones el doble.

En el Distrito Federal, a partir de 2001 se incrementa el promedio de la edad al primer trámite, así como su desviación estándar, la siguiente tabla muestra los porcentajes de registro al padrón por grupos de edad:

Distrito Federal. Grupos de edad vs añodetramite1

	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
18-24	59.99	47.57	55.62	58.66	58.19	54.35	49.47	53.72	61.06	66.82
25-29	11.45	14.48	13.49	11.88	11.72	12.22	12.05	11.08	9.74	8.00

Es claro que ha habido un incremento de ciudadanos de más de 55 años que se han registrado por primera vez después de 2001, es claro que el incremento en términos absolutos del porcentaje no es muy alto, pero en los grupos de 70 años o más este incremento es hasta tres veces el porcentaje anterior. En 2005 hay un descenso de registro en esos grupos de edad, pero todavía es superior al porcentaje de registro de esos grupos de edad antes de 2001. También es notorio a partir de 2004 el incremento de registro en los menores de 25 años, ambas situaciones contribuyen a un aumento de la desviación estándar del promedio de la edad al primer trámite.

Conclusiones

A través de estos análisis se pueden ver varias cosas:

Existe una gran concordancia con los resultados obtenidos utilizando el padrón de 2003 y el de 2006, en todos los análisis realizados.

Los cambios de efecto en la edad credencial del género son explicables por un cambio en la relación de ocupación con sexo. Mientras que la relación de natal con la edad de la credencial en Quintana Roo sigue un patrón diferente que en el resto de los estados, ya que la mayor parte de los ciudadanos en el padrón no nacieron en esa entidad.

En cuanto al análisis de varianza, para ver el comportamiento de la edad al primer trámite, los puntos que más se resaltan son el hecho de que efectivamente se ha ido reduciendo de manera importante la edad en la que los ciudadanos se inscriben por primera vez al padrón.

En algunas entidades el registro no disminuyó en 2004, como había sido previamente en todos los años posteriores a elecciones federales.

Por último aunque hubo un incremento en el registro de personas mayores a 55 años, en Michoacán a partir del 2003 y en el Distrito Federal a partir del 2001, este es importante con respecto a los registros de los años previos, pero el porcentaje con respecto a los registros por año sigue siendo muy pequeño. Por otro lado en el Distrito Federal también es notorio el incremento de registro en la población joven.
